Denominal affixes as sources of antipassive markers in Japhug Rgyalrong

Abstract

In this paper, we review the documented diachronic pathways leading to antipassive markers in the world’s languages and show that Japhug Rgyalrong, a polysynthetic language belonging to the Sino-Tibetan family, attests a previously unreported source of antipassives. In Japhug, the two antipassive constructions (human and non-human antipassive) are built from the base verb through a two-step process: first nominalization into an action nominal, and second denominal verbalizing derivation of the action noun into an intransitive verb. Nominalization neutralizes the verb’s transitivity, and a new transitivity value is allocated by the denominal prefix.

A similar pathway is proposed for other derivations, in particular the applicative.

Keywords: Antipassive; Applicative; Causative; Denominal verbs; Nominalization; Action nominals; Rgyalrong; Japhug; Nahuatl; Eskaleut; Grammaticalization

1. Introduction

The diachronic origin of antipassive markers, unlike that of passive markers and constructions (for instance Haspelmath, 1990), has only attracted a limited amount of scholarship. This lack of research is due in part to the fact that antipassive constructions are less common than passive ones cross-linguistically, but also that many constructions that could have been described as antipassives are usually described with a different terminology, especially in languages whose flagging is aligned accusatively.

Antipassives are overtly marked intransitivizing constructions that demote the patient of transitive verbs, whereby the agent of the original verb (A) becomes the only argument (S) of the verb in the antipassive construction; the demoted O either receives oblique case or is deleted from the construction. This definition allows for constructions variously labelled as ‘depatientive’, ‘detransitive’, ‘deaccusative’ or ‘deobjective’ in accusative languages to be designated as antipassive,
following authors such as Heath (1976), Polinsky (2011) and Creissels (2012), but excludes agent-preserving lability and incorporation.

Previous work has pointed out five cross-linguistic origins for antipassive markers, presented in Table 1:

A detailed account of the Nahuatl antipassive is provided in Section 4.3.

This issue will be discussed in more detail in Section 4.

In West Mande, Creissels (2012) similarly argues that the antipassive suffixes –ndì in Soninke originate from a verb root that can be reconstructed as *tin ‘to do’, and that the antipassive construction in question comes from a periphrase comparable to French acheter (‘to buy’, transitive) ⇒ faire des achats (‘to do shopping’, with the verb faire ‘to do’).

In this paper, we present a related, but slightly different, pathway of grammaticalization of the antipassive in Japhug, a polysynthetic Sino-Tibetan language spoken in Sichuan, China. Like the Greenlandic case, it involves two steps: nominalization of a transitive verb and then denominal derivation back into a verb. An important difference of the Japhug case from both Eskaleut and West Mande is that denominal derivational prefixes cannot be etymologically derived from a verb.

This paper is divided into four sections. First, we present background information on Japhug in general, in particular on nominalization and transitivity. Second, we offer an account of the antipassive construction in Japhug and discuss all the derivational prefixes homophonous with the antipassive prefixes. Third, we provide arguments showing that one of the two antipassive prefixes originates from a denominal construction. Fourth, we show that a similar scenario can be proposed to explain the origin of the applicative marker.

2. Background information

Japhug Rgyalrong is a polysynthetic language belonging to the Sino-Tibetan family, spoken by fewer than 10000 speakers in M barkhams county, Rngaba district, Western Sichuan, China.

The closest relatives of Japhug are the other Rgyalrong languages: S itu, Tshobdun, and Showu. The distribution of the four Rgyalrong languages is indicated in Fig. 1; the black dot represents the Japhug speaking area.
Like other Rgyalrong languages, Japhug presents a very rich system of prefixal voice derivation, including causative, applicative, passive, anticausative, antipassive (Jacques, 2012b) and incorporation (Jacques, 2012c); transitive verbs agree with two arguments in person and number.

In this section, we present all background information needed to follow the argumentation: transitivity marking in Japhug, nominal morphology and nominalization. Antipassive derivation in Japhug is described in more detail in Section 3. We will in particular discuss the fact that no less than four different $tɯ$-- prefixes are found in nouns, a topic that will be of importance for our diachronic hypothesis in Section 4.

2.1. Nominal morphology

As the present article will discuss the derivation of verbs from nouns, some information on nominal morphology is necessary. Three features of nouns are described here: possession and number.

The main morphological feature of Japhug nouns is possession. Nouns can be divided into two main categories: inalienably and alienably possessed nouns. Inalienably possessed nouns require a possessive prefix in all cases, while alienably possessed nouns may or may not have such a prefix.

Inalienably possessed nouns must either bear one of the possessive prefixes in Table 2. The indefinite possessive prefix has two variants $tɯ$– and $tɤ$– whose distribution is lexically determined. Alienably possessed nouns can take the prefixes in Table 2, but not the indefinite possessive prefix.

In this paper, inalienably possessed nouns will be cited by their root form with a hyphen indicating the obligatory presence of a possessive prefix. Thus –$jau$ ‘hand’ implies that the form *$jau$ on its own is not possible for the meaning

---

6 This terminology follows works such as Thompson (1996) on Athabaskan languages; see also Sun (1998) on the related Tshobdun language.
hand, and one will either find the indefinite form tɯ-jaʁ ‘someone’s hand’ or a form with a possessive prefix such as a-jaʁ ‘my hand’, nɤ-jaʁ ‘your hand’ etc.

Inalienably possessed nouns (1 and 2) can be converted to alienably possessed by adding a possessive prefix before the indefinite possessor (example 3).

(1) ɯ-ɯʁw
3SG.POSS-horn
Its horn

(2) ta-ɯʁw
INDEF.POSS-horn
A horn

(3) ɯ-ta-ɯʁw
3SG.POSS-INDEF.POSS-horn
His horn (the horn taken from an animal)

This phenomenon is not restricted to Rgyalrong languages, but also found in other languages with possessive affixes, such as Athabaskan.7

Aside from possessive prefixes, an important morphological category occurring in the nominal domain are the numeral prefixes of quantifier nouns (Table 3; only numerals up to 10 are indicated, but all numerals up to one hundred can occur as prefixes). These nouns include measure of time (tɯ-xpə ‘one year’ etc), of length (tɯ-tɣa ‘one handspan’ etc), various quantities (tɯ-ɣdɤ ‘one section’ etc) or classifiers (tɯ-rdoʁ ‘one piece’ etc).

7 For instance in Navajo we find a similar opposition between sɨ-tʃi’ 1SG.POSS-flesh ‘my flesh’ and she-a-tʃi’ 1SG.POSS-INDEF.POSS-flesh ‘my meat (bought at the marker)’ (Young and Morgan, 1987:10). The theoretical implications of this phenomenon go beyond this paper.
Although the numeral prefix $tu$– is formally similar to the indefinite possessor $tu$–, the two are entirely distinct, as they alternate within different paradigms (respectively Tables 2 and 3). It is not possible to add both series of prefixes on the same quantifier noun. Non-quantifier nouns cannot receive numeral prefixes. Numeral prefixes are obligatory with quantifier nouns. The only exception is observed with measures of time: the numeral prefixes can be replaced with the third person possessive $ɯ$– to express the meaning ‘that (particular) year’, ‘that day’ etc, as in example 4.

(4)  $nu$  $ɯ$-$xpa$  $ta$-$xpa$  $maka$  $mv$-$pe$  $tu$-$ti$-$nu$

‘People say that the harvest is not good in a year like that.’ (Lhamtshams.32)

No other possessive prefix may be used with these measure nouns.

2.2. Nominalization

Japhug Rgyalrong, like other Rgyalrong languages (see for instance Sun, 2003 on the Tshobdun language), has a very rich system of nominalization prefixes. Four different prefixes are productive: the S/A nominalization $kɯ$–, the O nominalization $kɤ$–, the oblique nominalization $sɤ$– and the action nominalization $tɯ$–. This section will briefly describe the first three, then describe the prefix $tɯ$– and prefixless nominalized forms in more detail, as the latter two will be more relevant to our diachronic hypothesis in Section 4.

2.2.1. Argument and adjunct nominals

The nominalized forms derived with the three first prefixes $kɯ$–, $kɤ$– and $sɤ$– are fully productive, and can be used to build relative clauses (Jacques, 2004:464–9). The S/A nominalization prefix $kɯ$– appears with both intransitive and transitive verbs, but in the latter case a possessive prefix (from Table 2) coreferent with the patient is added (see 6). This nominalized form can be used as one of the tests to determine whether a particular verb is transitive or intransitive (cf. Section 2.3)

(5)  $kɯ$-$si$

‘The dead one’.

(6)  $ɯ$-$kɯ$-$sat$

‘The one who kills him.’

The nominalization prefix $kɯ$– has two irregular forms $ɣ$– or $x$– which can be found in a few nouns (Table 4). Most of these nouns are possessed nouns, but mainly occur with the third person singular possessive $ɯ$–.

The semantic relationship between the base verb and the derived nouns in Table 4 is not entirely obvious synchronically, as the nouns have undergone an independent semantic evolution. The changes from /k/ → /ɣ/ and /k/ → /x/ on the other hand are perfectly regular in Japhug; the phonological irregularity lies in the loss of the vowel only.

As the first element of a cluster in Japhug, stops only occur before the non-nasal sonorants /r/, /j/, /w/, /l/ and /ɣ/.

A few minor exceptions are discussed in Jacques (2004:45, 261), but are of no incidence to the present discussion.
closely related Situ language (Jacques, 2004:270; for instance, –txr ‘brother’ corresponds to Situ Rgyalrong –kték), which suggests that as the first element of clusters, stops have undergone fricativisation in Japhug.

Since the language disallows clusters of the type stop + nasal as well as stop + s altogether, and since the velar fricatives /x/ and /ɣ/ always agree in voicing with the following consonant in clusters (all other possibilities - *kn-, *xn-, *gn-, are not acceptable clusters in Japhug). Note that irregular nouns in Table 4 are attested for only verbal roots with a simple initial consonant, without any cluster (prenasalized voiced obstruents count as one phoneme in Japhug). This is by no means a coincidence, but rather an effect of the fact that with clusters, the /k–/ prefix would have been dropped without a trace.

Alongside the nouns in Table 4, all four verbs allow the phonologically and semantically regular corresponding nominalized forms (kuw-pab ‘the black one’, kuw-so ‘the empty one’ etc), which were regularly created after the irregular nominalizations became opaque.

The irregular loss of vowels in the examples in Table 4 is by no means limited to the nominalization prefix kuw–, as it is also observed with the animal class prefixes kuw– which becomes x–/ɣ– in some examples but not in others. Comparison with Situ Rgyalrong, which never undergoes vowel loss in prefixes, allows one to detect these examples.

The examples in Table 5 suggest that vowel attrition only takes place in words whose second syllable has a simple onset (does not begin in an initial cluster), a feature shared with the examples of Table 4.9

Vowel attrition of prefixes occurs either with non-productive prefixes such as the animal class prefix or with productive prefixes (such as the S/A nominalization prefix kuw–) that become reanalyzed as a part of the stem due to the semantic evolution of the deverbal noun in question. Another such example is studied in Section 2.2.2.

### 2.2.2. Action nominals

Beside the argument and adjunct nominalization prefixes studied in the previous subsection, we also find action or result nominals in tuw–.

The literature on Rgyalrong languages designates these forms as ‘action nouns’ (Jacques, 2004:455) or ‘lexicalized action nominals’ (Sun and Lin, 2007).10

Action nominals can be used to refer to the action or process designated by the verb. They can occur in constructions with a light verb such as (7), or as the complement of the verb za ‘to begin’ (8); both intransitive and transitive verbs can participate in such constructions.

(7)  
\[
\text{tuw} \text{-} \text{ra}b \quad \text{puw} \text{-} \text{bzu} \text{-} \text{t} \text{-} \text{a} \\
\text{NMLZ: ACTION- dance} \quad \text{PFV: DO-PST-1SG} \\
\text{‘I danced.’}
\]

(8)  
\[
\text{u} \text{-} \text{di} \quad \text{tuw} \text{-} \text{mnvm} \quad \text{ta} \text{-} \text{za} \quad \text{tce} \quad \text{d} \text{-} \text{a} \quad \text{to} \text{-} \text{rvru} \quad \text{tu} \text{-} \text{ti} \text{-} \text{nu} \quad \eta \text{u} \\
\text{3SG.POSS-smell} \quad \text{NMLZ: ACTION-smell} \quad \text{PFV: 3–3-begin} \quad \text{LNK alcohol} \quad \text{EVD-get.up} \quad \text{IPFV-say-PL} \quad \text{NPST: be} \\
\text{‘When it starts to smell, people say ‘the alcohol has fermented.’} \quad \text{(Alcohol, 77)}
\]

Action nominals cannot take any TAM markers but can receive possessive prefixes. However, the possessor does not necessarily correspond to any of the arguments of the original verb. For instance, in the case of the noun tuw-ra‘a dance’

---

9 In any case, even if counterexamples to this generalization are found, this would not be surprising, as vowel attrition in presyllables and monosyllabicization tend to be a sporadic process in its first stages (see Michaud, 2012).

10 There are two distinct scholarly traditions on this particular topic, Comrie (1976) and Koptjevskaja-Tamm (1993:5) on the one hand who use the terms ‘action nominal’ and ‘action nominal constructions’, and Grimshaw, 1990 on the other hand, whose work focuses on the distinction between process and result nominals which is not taken into account in Koptjevskaja-Tamm (1993). We retain here the term ‘action nominal’, this construction would be labelled as ‘result nominal’ in Grimshaw’s framework.
derived from the intransitive *rau* ‘to dance’, possessive prefixes as in *tu-tu-rəw* ‘his dance’ are generally interpreted as the beneficiary of the action, not the dancer (‘a dance performed in his honour’).

With stative verbs, *tu*- nominals express the abstract property of the verb (like the derivation of nouns from adjectives by the suffix *-ness* in English) and are better labelled as ‘property nominals’. *tu*- nominals commonly occur in a degree construction, followed by another stative verb indicating degree such as *sə*və* to be extremely... or *səre* ‘to be ridiculous, to be terribly...’

(9) *βyən nə li ɯ-di ɯ-tu-səvəsə* syəre *zo*

badger TOP too 3SG.POSS-smell 3SG.POSS-NMLZ:PROPERTY-awful NPST:terrible EMPH

‘The badger’s smell is awful.’ (‘the badger’s smell’s awfulness is terrible’)

Unlike the argument nominals discussed in the previous subsection, *tu*- action nominal derivation is not fully productive, and the semantics of the action nominals is not always predictable. In some cases, it refers to the result of the action rather than the action itself (thus *tu-ka*$ \( \sim \) ‘woven cloth’ from *ka*$ \( \sim \) ‘to weave’) or even the object of the action (*tu-ts$'i$ *ri* ‘rice porridge’ from ts$'i$ *ri* ‘to drink’) and the semantics of the noun is not always predictable and tends to be more specific than that of the verb. It is however cross-linguistically quite common for action nominals to present this kind of irregular semantics for some nouns (Koptjevskaja-Tamm, 1993:20–21).

Table 6 illustrates the most representative examples of such irregular nouns. Apart from numerous examples with irregular semantics, we also find two examples with irregular phonology.

In the following, we provide a detailed account of one action nominal with irregular semantics (*tu*pəra* ‘land reclamation’) as well as of the two action nominals with irregular phonology. These three examples will be relevant to our hypothesis on the origin of the antipassive in Section 4.

### 2.2.2.1. Irregular semantics.

The transitive *pyə* ‘to turn around, turn over’ has numerous meanings. It can be applied to sheet-like objects, and with clothes it can even mean ‘to wear inside out’. It has other specialized meanings like ‘to cross a mountain’, ‘open the cover/lid’ or ‘to plough a field’, with different directional prefixes.

(10) *ndzi-pəvə*β nə tu*$ \( \sim \) ji*$ \( \sim \) pə* $ \( \sim \) tən nə qalə ci ku to-pəra* ri 3SG.POSS-between TOP LOC curtain one EVD:IPFV-exist COORD DEM wind one ERG EVD-turn.over but ‘Between them, there was a curtain, and a wind turned it over.’ (The frog, 98)

(11) *ɯ-fkaβ* ta-pəra 3SG.POSS-cover PFV:3→3 UP-turn.over ‘He opened the cover.’ (Lobzang, 49)

The meaning ‘to plough’ is always associated with directional prefixes indicating the ‘upstream’ direction (the same as all verbs meaning ‘to dig’ in the language):

(12) *tu*$ \( \sim \) la-pəra field PFV:3→3 UPSTREAM-turn.over ‘He ploughed the field.’

On the other hand, the nominalized form of the verb only has one meaning: the action of reclaiming land by ploughing for the first time (in Chinese 开荒 kaihuang), as illustrated by the following example from the Flood myth:

(13) *tu*pəra lo-təvə* ndzi EVD:UPSTREAM-take.out-du ‘They $du$ reclaimed land.’ (The flood, 85)

Table 6

Examples of irregular action nominals and their base verbs.
In the following, we will show that this derives from the origin of the antipassive in Japhug.

2.2.1

As the argument nominals discussed in Section 2.2.1, there are also a few action nominals with irregular phonology.

First, the transitive verb *ntsye ‘to sell’ has an action noun *ntsye ‘commerce’ which presents a stem /tsye/ distinct from that of the base verb in lacking a n-.

Second, the possessed noun --*nŋa ‘debt’ appears to be related to the verb *ŋa ‘to owe’ but it lacks a derivational *tw- prefix and has a additional n- element.\(^\text{11}\) In the following, we will show that this n- is a trace of the derivational *tw- prefix.

We saw in Section 2.2.1 (Table 4) that irregular argument nominals were formed by deleting the vowel of the derivational prefix and applying automatic phonological changes to the prefixed stop (kw- becomes y- or x- in these nouns). We mentioned that comparative evidence with Situ Rgyalrong indicate that velar and labial stops underwent fricativization in Japhug when occurring as first member of clusters having an obstruent as second member. In the case of coronal stops however, clusters with /t/ or /d/ followed by a consonant other than a non-nasal sonorant exist in Japhug in internal position (though mainly in loanwords from Tibetan across morpheme boundaries).

Let us now observe the synchronic distribution of clusters which have a nasal as second member in Japhug (data from Jacques, 2004).

We see that there are no clusters with a nasal velar as the first element (*nm-, *ŋm-) but that on the other hand there are no clusters with a dental or a labial non-nasal (*nb-, *nt-). Moreover, n- as the first element of a cluster has a very restricted distribution. It occurs only (i) before a coronal stop or affricate (clusters such as /nt/\(^\text{2}-l/ /ints/-/ /nts/- etc, where it is the realization of the homorganic nasal archiphoneme /N/), (ii) before voiced prenasalized stops (/nmb/ and /nngl/, transcribed as nb- and ng- in this work) (iii) before nasal consonants (the examples in Table 7). n- is conspicuously absent as the first element of a cluster before labial and velar stops (outside of the voiced prenasalized one). Thus, one does not find clusters such as *np- or *nk- in Japhug.

If n- as first element of a cluster in cases (ii) and (iii) originated from *n- in pre-Japhug, there would be no reason why only nmb- and nm- are possible while *np- and *ŋp- are not. A solution to this paradox is to assume that n- in cases (ii) and (iii) originate from *lv, which underwent retrograde nasality assimilation, as indicated in Table 8.

The best evidence for this sound law comes from loanwords from Tibetan, where internal t + nasal clusters automatically undergo these changes (for instance Tibetan mt obscured.me ‘traditional lamp’ and rgod.ma ‘mare’ were borrowed as mt obscured.\(^\text{2}vmi and rgonma).\(_\text{12}\)

Thus, equipped with this sound law, it is possible to reconstruct --*nŋa ‘debt’ as *ŋa in pre-Japhug, a form coming from the expected regular form *tunga by loss of the vowel. This is the only known case in Japhug when a action nominal prefix *tw- undergoes irregular vowel loss.

This particular example will be relevant to our discussion in Section 4 on the origin of the antipassive in Japhug.

---

\(^\text{11}\) Since --*nŋa is a inalienably possessed noun, its form without definite possessive prefix is *tu-nŋa, but the *tu- here is the indefinite possessor prefix, and alternates with the series of possessive prefix in Table 2.

\(^\text{12}\) The Tibetan transliteration used here follows Jacques (2012a).

2.2.3. Bare infinitive and derived inalienably possessed nouns

Besides tu– prefixed nominals, we also find another type of action nominal: bare infinitives. These non-finite forms are formed by combining the bare base stem with a possessive prefix coreferent with the patient, as w-mto in (14). Only transitive verbs can form bare infinitives (intransitive verbs use k- prefixes in the same contexts).

(14) ɗv蛲 ƙw-fse a-ŋk3or nw w-mto mw-pu-ŋp-t-a
you NMLZ;STATIVE-be.like 1SG.POSS-subject TOP 3SG-BAKE-INF:SEE NEG-CPFV:EXPERIENCE-PST:TR-1SG
‘I never saw anyone like you among my subjects.’ (Smanmi metog koshana1.157)

We also find bare infinitives instead of action nominals with the verb za ‘to start’ when the patient is an overt noun phrase, as in example 15.

(15) tʃvʊɛz ƙw-rxt pa-za
letter 3SG.POSS-BAKE-INF:WRITE PFV:3-3-START
‘He started writing a letter.’ (elicited)

The bare infinitive can also be used as an action nominal in combination with the noun ts3wya ‘form, appearance’ as in example 16.

(16) ndʒ-i-mi w-ts3wok w-ts3wya nʊra wʊmɑ zo naχtswya ndʒi.
3DU.POSS-foot 3SG-BAKE-INF:ATTACH TO 3SG-POSS-FORM TOP:PL VERY EMPH NPST:SIMILAR-DU
‘The way their feet (of fleas and crickets) touch the ground is very similar.’ (the cricket 17)

In addition to bare infinitives, there is a rarer formation of bare action nominalizations by prefixation of possessive prefixes to the bare stem of verbs; the indefinite possessor is either tu– or tv– (Table 9).

Given the absence of morphemes other than the possessive prefixes, it is legitimate to wonder whether the direction of derivation in the examples in Table 9 is indeed from verb to noun as posited here. The proof that this is indeed the correct direction of derivation is the fact that the verb ƙƙab ‘to cover’ is borrowed from Tibetan bkab, the past tense form of the verb ngebs ‘to cover’. The noun –ƙƙab ‘cover’ is clearly secondary and was created within Japhug, as there is no such corresponding noun in Tibetan.

2.3. Transitivity in Japhug

Since the focus of this paper is on valency-decreasing derivation, it is necessary to provide some information on transitivity marking in Japhug. Japhug, like all Rgyalrong languages, has a very clear distinction between transitive and intransitive verbs, which is reflected in both case marking and verbal morphology. Morphological transitivity is unambiguous and marked in different but congruent ways, some of which have been mentioned above.

First, Japhug is a strongly head-marking language, with person and number of both arguments marked on the verb (Jacques, 2010a). Only transitive verbs can receive the inverse prefix wьw–, the portmanteau prefixes ku– (2–1), ta– (1–2), the perfective direct 3–3’ a– prefix or the 1/2SG–3 –t suffix (the latter only occurs in open-syllable stem verbs).

Second, Japhug has ergative flagging: S and P are unmarked (examples 17 and 18), while the A of a transitive verb receives the clitic ku (example 18). This clitic is obligatory with nouns and third person pronouns, but optional for first and second person pronouns. The ku clitic can also be used to mark instruments.

(17) tv-ƙwu nʊ jʊ-ce
IND.MARK-BOY TOP EVD-GO
‘The boy went (there).’
Third, some transitive verbs present a special stem in direct 123SG→3 forms. The regular pattern is that verbs whose stem is in –o, –u, –a and –w change to –əm, –e, –e and –i, respectively. This stem alternation does not occur with intransitive verbs.

Fourth, argument nominalisation of transitive and intransitive verbs present tripartite alignment, as the S nominalization is marked by ku–, while A nominalization is marked by a possesive prefix followed ku– and P-nominalization by kv– (Section 2.2.2). Argument nominalization can therefore always be used to distinguish transitive from intransitive verbs.

There are a few labile verbs in Japhug, and all present agent-preserving ambitransitivity (Jacques, 2012b:217–9). When used intransitively, labile verbs are interpreted as having an undefined patient, as in example (19).

Non-overt patients of non-labile transitive verbs on the other are always interpreted as a referent previously mentioned in the text. Thus, in a sentence such as 20, the verb tu-ndze (IPF-eat[III]) can only mean ‘eat it’, never ‘eat something’.13

There are three ways to have an unspecified patient with a non-labile transitive verb. First, the generic human marker ku– can be prefixed to the verb.14 Second, an indefinite pronoun such as THE Former is used to delete a non-human patient cannot be reintroduced with oblique case in Japhug antipassive (Section 2.2.2). Argument nominalization can therefore always be used to distinguish transitive from intransitive verbs.

There are a few labile verbs in Japhug, and all present agent-preserving ambitransitivity (Jacques, 2012b:217–9). When used intransitively, labile verbs are interpreted as having an undefined patient, as in example (19).

Non-overt patients of non-labile transitive verbs on the other are always interpreted as a referent previously mentioned in the text. Thus, in a sentence such as 20, the verb tu-ndze (IPF-eat[III]) can only mean ‘eat it’, never ‘eat something’.

There are three ways to have an unspecified patient with a non-labile transitive verb. First, the generic human marker ku– can be prefixed to the verb.14 Second, an indefinite pronoun such as THE Former is used to delete a non-human patient cannot be reintroduced with oblique case in Japhug antipassive (Section 2.2.2). Argument nominalization can therefore always be used to distinguish transitive from intransitive verbs.

There are a few labile verbs in Japhug, and all present agent-preserving ambitransitivity (Jacques, 2012b:217–9). When used intransitively, labile verbs are interpreted as having an undefined patient, as in example (19).

There are three ways to have an unspecified patient with a non-labile transitive verb. First, the generic human marker ku– can be prefixed to the verb.14 Second, an indefinite pronoun such as THE Former is used to delete a non-human patient cannot be reintroduced with oblique case in Japhug antipassive (Section 2.2.2). Argument nominalization can therefore always be used to distinguish transitive from intransitive verbs.

There are three ways to have an unspecified patient with a non-labile transitive verb. First, the generic human marker ku– can be prefixed to the verb.14 Second, an indefinite pronoun such as THE Former is used to delete a non-human patient cannot be reintroduced with oblique case in Japhug antipassive (Section 2.2.2). Argument nominalization can therefore always be used to distinguish transitive from intransitive verbs.

3. Antipassive in Japhug

Two productive antipassive prefixes are found in Japhug: rv– and sv–.15 The former is used to delete a non-human patient (par ‘to search’ → rv-car ‘to search for things’) while the second is used to delete a human patient (par ‘to search’ → sv-car ‘to search for people’).16 The patient cannot be reintroduced with oblique case in Japhug antipassive constructions, except for some ditransitive verbs (3.2). Labile verbs cannot form antipassives.

13 In this particular example, the non-overt patient is mice as a species, which were referred to previously in the text; in Japhug generic referents can be either singular or plural.
14 The generic marker for S and P in Japhug is ku–, a prefix unrelated at least synchronically to the homophonous nominalization prefix ku– (Jacques, 2012b:204–89). Generic marking in Japhug will not be discussed in this paper. Unlike human antipassive, generic patients in ku– can be topical, and this form is typically used in gnomic statements and procedural texts.
15 There is a third antipassive prefix cum– only attested with the verb fru ‘to ask’ → cumfru ‘to ask a lot of questions’.
16 A similar situation is found in the closely related language Tshobudun, (Sun, 2006:8), and a typological parallel is observed in Nahuatl which also has a human antipassive it– and a non-human antipassive ti– (Creissels, 2006:91).

As illustrated in Table 10, the formation of the non-human *rv*– antipassive is perfectly regular (it has an allomorph *ra*– before a uvular fricative in closed syllables), except for the verbs *ŋɛ* ‘to owe’ and *ntsye* ‘to sell’, the first of which is discussed in detail in Section 4.1.1.

The non-human antipassive *rv*– detransitivizes transitive verbs, and the S of the derived verb corresponds to the A of the base verb: this is an agent-preserving derivation, unlike the passive and anticausative. The verb takes an intransitive conjugation and the S appears without ergative marking:

(22) \( tɛv-ɾzæβ \)

INDEF.POSS-wife TOP EVD.IPFW-ANTIPASS:NON.HUMAN-mend

‘The wife was mending (clothes).’ (The raven 19)

The human antipassive *sv*– prefix presents the allomorph *sa*– before a uvular fricative in closed syllables and the optional variant *svz*– in a few verbs whose stem begins in *ɣv*– (Table 11).

In the closely related Tshobdun language, Sun (in press) reports two distinct patient-suppressing *se*– prefixes, the human antipassive *se*– (deriving action verbs, as *ntʃʰɛ ‘to kill’ \( \rightarrow \) *se-ntʃʰɛ ‘to do killing (of people)’) and a prefix *se*– deriving stative verbs meaning ‘to have a propensity for ∨-ing’ (if \( f^u\) ‘to gore’ \( \rightarrow \) *se-ʃfʰu* ‘to have a propensity for goring (people’)).

In Japhug, the situation is very similar to that of Tshobdun, but it is unclear whether two distinct prefixes must be posited. Human antipassive verbs can be either action verbs or propensity stative verbs depending on the context.

For instance, the human antipassive *sv*-sat of the transitive verb sat ‘to kill’ can be both used as a propensity stative verb *sv*-sat ‘have a killing power’ (example 23) or as an action verb ‘to kill people’ (examples 24 and 25). It should be noted that the implied patient of propensity stative verbs is generally human, but in some cases can be applied to animals as well. For instance *sv*-sat ‘have a killing power’ can designate the killing of both animals or people.

(23) \( nụnumu \) \( wuma \) \( ɔzo \) \( nụ-sv-sat \)

this very EMPH CONST-ANTIPASS:HUMAN-kill

‘Its killing power is considerable (of a gun).’ (Guns, 117)

\(^{17}\) *se*– in Tshobdun is the form regularly corresponding to Japhug *sv*–.
(24) \(kv\text{-}sy\text{-}sat\) \(pj\text{-}y\text{-}rno\)
\(\text{INF\text{-}ANTIPASS\text{-}HUMAN\text{-}kill\ EVD\text{-}experience}\)
‘He has killed [a man] before.’ (In Chinese: 他杀过人)

(25) \(kuw\text{-}sy\text{-}sat\) \(jo\text{-}ce\)
\(\text{NMLZ\text{-}S/A\text{-}ANTIPASS\text{-}HUMAN\text{-}kill\ EVD\text{-}go}\)
‘He went to kill [people].’

In general, human antipassive verbs appear to allow both meanings. For instance, the antipassive \(sy\text{-}mtsuy\) derived from \(mtsuy\) ‘to bite’ means both ‘to have a propensity for biting people’ and ‘to bite people’ depending on the context. Depending on the meaning of the base verb, some human antipassive verbs will more commonly tend to be action verbs; for instance, \(sy\text{-}car\), the antipassive of \(car\) ‘to search’, is usually an action verb ‘to search for people’ and cannot really be interpreted as meaning ‘to have a propensity for searching for people’ but this is probably more for pragmatic reasons than morphosyntactic ones.

Thus, we will not distinguish in this paper the action human antipassive from the stative antipassive, as this distinction in Japhug reflects specific uses of a single derivation rather than distinct derivations. The tendency of the antipassive construction to express repeated or habitual action rather than a punctual event is well attested cross-linguistically (cf. Cooreman, 1994:91–2).

3.1. Compatibility with other derivational prefixes

Jacques (2012c) describes the Japhug verb in terms of the template in Table 12. This table represents finite verb forms. In nominalizations, the prefixal slots 1, 5, 6 and all suffixal slots, which mark TAM and person, cannot be filled. Nominalization prefixes described in Section 2.2 always occur between slots 4 and 5.

1. Irrealis \(a\text{-}\) and \(\text{mtsuy}\text{-}r\text{-}\), Interrogative \(\text{t}u\text{-}\), conative \(j\text{-}\)wu-
2. negation \(m\text{-}a\text{-}/m\text{-}v\text{-}/\text{miw}\text{-}/\text{miw}\text{-}j\text{-}\)
3. Associated motion \(\text{cw}\text{-}\) and \(\text{yu}\text{-}\)
4. Directional prefixes (\(\text{ty}\text{-}\text{pu}\text{-}/\text{tv}\text{-}\text{tu}\text{-}/\text{tuw}\text{-} \text{kv}\text{-} \text{nuw}\text{-} \text{ju}\text{-}\text{-}\), \(\text{tu}\text{-} \text{pju}\text{-} \text{lu}\text{-} \text{c}\text{-} \text{ku}\text{-} \text{nuw}\text{-} \text{ju}\text{-}\)) permansive \(\text{nu}\text{-}\), apprehensive \(\text{cu}\text{-}\)
5. Second person (\(\text{tuw}\text{-}, \text{kw}\text{-} 2\text{-}1 and \text{ta}\text{-} 1\text{-}2\))
6. Inverse \(-\text{w}\text{-}/\text{Generic S/O prefix kuw}\text{-}, \text{Autobenefactive nuw}\text{-}, \text{Progressive asuw}\text{-}. The inverse and the autobenefactive can be infixed within the progressive \(\text{asuw}\text{-}\).
7. Reflexive \(\text{zy}\text{-}/\text{sy}\text{-}\)
8. Causative \(\text{suw}\text{-}, \text{Abilitative suw}\text{-}\)
9. Antipassive \(\text{sy}\text{-}/\text{ry}\text{-}\)
10. Tropative \(\text{ny}\text{-}, \text{applicative nuw}\text{-}\)
11. Passive or Intransitive thematic marker \(\text{a}\text{-}/\text{De-experiencer sy}\text{-}\)
12. Autobenefactive-spontaneous (appears in this position only when the passive/intransitive determiner is present, otherwise appears in positions 6)
13. Other derivation prefixes \(\text{nu}\text{-} \text{yu}\text{-} \text{ruw}\text{-} \text{ny}\text{-} \text{yu}\text{-} \text{ry}\text{-}\)
14. Noun root
15. Verb root
16. Past 1sg/2sg transitive \(-t\) (past tenses)
17. 1sg \(-a\)
18. Personal agreement suffixes (\(-\text{tgi}, \text{-}j\text{-}, \text{-nw}, \text{-ndzi}\))

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| a- | m\text{-}u- | m\text{-}x- | p\text{-}u- | p\text{-}w- | t\text{-}v- | t\text{-}w- | w\text{-}y- | z\text{-}y\text{-} | w\text{-} | y\text{-} | y\text{-} | a\text{-} | y\text{-} | w\text{-} | w\text{-} | noun | Σ | -t | -a | -nw | -ndzi |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 |
| etc. | etc. |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
As indicated in Table 12, antipassive prefixes occur after the causative prefix, but before the troponomic and denominal prefixes.

Example 26 illustrates the combination of an antipassive after the *z- allomorph of the causative prefix.

p.n. GEN 3SG.POSS-friend TOP ERG EVD-INV-ask.to.do COORD EVD-INV-CAUS-ANTIPASS-write IPFV-be

‘A friend of Daihao’s asked him to draw paintings.’ (The painter and the shepherd boy, 10)

The verb *z-rγ-ᵢᵣ ‘to cause to make drawings/writings’ derives from the antipassive rγ-ᵢᵣ ‘to make drawings/writings’ of the transitive verb rγ ‘to paint, to write’.

The reversed prefix order, namely ANTIPASS-CAUS-, appears to be attested in one example: rγ-j-ᵢᵣ ‘to give (to) people to drink’.18 However, this example is not a real counterexample to the verbal template in Table 12.

The antipassive rγ-j-ᵢᵣ derives from the irregular causative j-ᵢᵣ ‘to give to drink’ of the verb tsᵢᵣ ‘to drink’. However, this is a lexicalized causative, and there is no compelling evidence for considering the element j- as a causative prefix synchronically; the regular causative su-tsᵢᵣ ‘to cause to drink’ with fully predictable semantics also exists,19 and there is no other example of the allomorph j- of the causative prefix.

The antipassive cannot occur to the left of a regular causative prefix; forms such as *sv-su-tsᵢᵣ or *rv-su-tsᵢᵣ (intended meaning ‘to cause someone to drink’ or ‘to cause to drink something’) are categorically rejected by native speakers.

There are three examples of antipassives combined with the troponomic nγ–, a prefix that derives a transitive verb meaning ‘to find . . . to consider . . . ’ from a stative verb. For instance, sv-nγ–mpcr ‘to consider people beautiful’ derives from the troponomic nγ–mpcr ‘to find beautiful’ of the verb mpcr ‘to be beautiful’.

Finally, the antipassive prefixes commonly appear before denominal prefixes. For instance, the verb sv-nγ–blu ‘to trick people’ derives from the transitive prefixes and denominal verb nuw-blu ‘to trick’ which itself originates from the inalienably possessed noun uβ-blu ‘trick’, a loanword from Tibetan blo ‘mind, method, trick’.

Combinations of antipassive prefixes with other prefixes are not attested in our present corpus, but this is mainly due to issues of performance (to think of an appropriate context where a word combining for instance antipassive, troponomic and de-experiencer could be used) than an effect of grammatical constraints on prefix combination.

3.2. Antipassive of secundative ditransitive verbs

Ditransitive verbs in Japhug never mark more than two arguments on the verb, and most present indirective alignment: the theme (the given entity) is coded in the same way as the patient of a monotransitive verb.20 These verbs are attested with both human and non-human antipassive; for instance ꞌtⱼ ‘ask’ yields both rγ-ꞌtⱼ ‘ask something’ and sv-ꞌtⱼ ‘ask someone in marriage’. The antipassive cannot be used to delete the recipient for indirective verbs.

However, there are also two verbs with secundative alignment, whose recipient is coded as the patient of a monotransitive verb (mbi ‘to give’ and jtsᵢᵣ ‘to give to drink’), as shown in example 27.

(27) nγ-pi ni ꞌkw… qyiy ꞌnu-ra ꞌku-mum ꞌzni ꞌtu-nγ-ndza-ndzi, ꞌwu-kwu

2SG.POSS-elder.sister DU ERG . . . bread TOP:PL NMLZ:STATIVE-tasty THEY.DU IPFV-AUTO-eat:DU 3SG.POSS-side

gy-ku-eke ra azo ꞌnu-wy-mbi-a-ndzi, ꞌc’a ra ꞌzni ꞌku-nγ-ndzi-ndzi, ꞌazo ꞌwu-ᵣγo

PFV-NMLZ:S-burn PL I PFV-INV-give-1SG-DU alcohol PL THEY.DU IPFV-AUTO-drink:DUPST I 3SG.POSS-diluted.alcohol

ꞌnu-wy-jtsᵢᵣ-a-ndzi ꞌpim-du

PFV-INV-give.to.drink-1SG-DU PST.IPV-be.assert

‘Your two sisters ( . . . ) ate the tasty food and gave me the burned part of the bread, drank the alcohol and gave me diluted alcohol to drink.’ (The frog, 68).

The two verb forms ꞌnú-wy-mbi-a-ndzi ‘they给了我’ and ꞌnú-wy-jtsᵢᵣ-a-ndzi ‘they给了我 to drink’ are 3DU→1SG, and the theme is not marked on either verb.

Since recipients are prototypically human, one would expect that the antipassive of these secundative ditransitive verbs would be formed using the sv- human antipassive. However, when they undergo antipassivization, these verbs

---

18 See Section 3.2 for the reason why rγ– is present here instead of sv–.
19 The semantic difference between the irregular causative jtsᵢᵣ and the regular one su-tsᵢᵣ is very clear. The former specifically means ‘to give something to drink to ease thirst’, while the second has the full range of meanings of causatives, including ‘to force to drink’, ‘to cause to drink inadvertently’ and ‘to drink with (an instrument)’.
20 We follow here Malchukov et al. (2010)’s terminology.
Table 13

</tbody>
</table>

take the prefix ry- instead of sy-. The theme can be present in the sentence, though the verb is morphologically intransitive, and the agent is not marked in the ergative. Thus, in 28, had the verb been transitive a transitive past suffix –t would have been expected between the verb stem and the personal suffix.21

(28) stɔ:]ru ru-rv-mbi-a  
bean PFV-ANTIPASS-give-1SG  
I gave beans (to someone).

In 28, the recipient is unspecified, but unlike antipassive verbs derived from simple transitive verbs, it can be reintroduced with an oblique case (dative marking):

(29)  azo tɔ-tcw ra nuw-ci a  
1SG INDEF.POSS-boy PL 3PL-DAT alcohol IPFV-ANTIPASS-CAUS-drink-1SG  
ngrvl  
n.PST:be.usually.the.case  
I usually give drinks to the guys.

Constructions like 29 with antipassive and an overt recipient are uncommon but can be elicited.

3.3. Denominal prefixes

Japhug has a rich array of denominal prefixes, two of which are formally identical to the antipassive ry- and sy-. This homophony raises the question whether these prefixes are diachronically related, which will be discussed in Section 4.

In this section, we offer general information on denominal derivations and describe in more detail the ry- and su- derivations specifically.

3.3.1. Denominal derivation

There is no evidence of denominal zero derivation in Japhug; derivation from noun to verb requires the addition of one of the seven denominal prefixes (Jacques, 2012c: 1217, cf. Table 13).

When inalienably possessed nouns and quantifier nouns undergo denominal derivation into verbs, the possessive prefixes and the numeral prefixes are invariably suppressed, as shown by the examples in Table 14.

Some of these prefixes present two allomorphs, one with υ vocalism and the other with x vocalism. When the base noun is inalienably possessed, the vocalism of the denominal prefix generally follows that of the indefinite possessor: when the base noun has ty-, the derived verb will have a denominal prefix in ry-, nu-, su- or yu-, and when the base noun has an inalienably possessed prefix in ty-, the denominal verb will have the x series of prefixes ry-, ny-, sx- or yx-.

This rule however has a few exceptions.

For quantifier nouns and all other nouns, both υ and x denominal prefixes are attested (Table 15).

Exceptions to the vowel copying principle between indefinite possessor and denominal verb can be found: there are examples of inalienably possessed nouns with ty- indefinite possessor whose denominal verbs have x vocalism,22 but the reverse is not true: there are no nouns in ty- with denominal verbs in υ.

Action nominal prefixes can be preserved after denominal derivation, as shown in Table 16.23

---

21 Its transitive equivalent is nuw-mbi-l-a PFV-give-PST:TR-1SG 'I gave it to him', a form where the recipient is always definite.

22 For instance –ymxr ‘mouth’ has the indefinite possessor prefix ty- but its denominal verb is ny – ymxr ‘to hold in the mouth’

23 Although both nuwtsvxl and ftsvxl are translated by the same English gloss, their meanings are different. The first one has human S, while the second must have the body part inalienably possessed noun –xtu ‘belly’ as its only possible argument.

### 3.3.2. Denominal rv- prefix

The denominal ruw-/rv- prefix is very productive, and generally used to derive intransitive verbs out of a noun. Verbs derived with this prefix can refer to the production of the entity designated by the base noun either by active building (as in the example ‘make a nest’ in Table 17) or by spontaneous effect (‘to have a skin’). In a few cases, ruw- / rv- can be used to derive a verb meaning ‘becoming noun’ (as in ‘to become a nun’). Finally, it can derive either transitive or intransitive verbs whose meaning is to perform the activity referred to by the base noun (‘harvest’ → ‘to harvest’).

The distribution of the allomorphs ruw-/rv- generally follow the rules presented in the previous section. Inalienably possessed nouns with tv- indefinite possessor and quantifier nouns always have a denominal verb in rv-; inalienably possessed nouns and other nouns can have either ruw- or rv-.

Table 18 provides a complete list of types of denominal verbs in ru- or rv-. From this list, it appears that transitive verbs are less common than intransitive ones (5 out of 25), and among these transitive verbs three are derived specifically from quantifier nouns such as tu-spra ‘one handful’.

The prefix ru- or rv- is extremely productive and can be applied to Chinese loanwords, in which case it always derives an intransitive verb. There are no other derivational prefixes rv- or ru- in Japhug.

3.3.3. Denominal sv- prefixes

The denominal verbs in su- or sv- can be either transitive or intransitive, and belong to four semantic categories: property, position, use of an instrument or body part, and causative, as presented in Table 19.

The total count of examples in each category of the su- or sv- denominal derivation in our forthcoming dictionary is listed in Table 20.24

The intransitive verb sv-مبرu ‘to become angry’ derived from the possessed noun tv-مبرu ‘anger’ has an irregular causative form sv-z-مبرu ‘to anger’, with the causative prefix -z- inserted between the denominal prefix and the root. This causative form is highly regular and isolated, and constitutes an exception to the template presented in Table 12.

24 These figures slightly differ from those presented in Jacques (2012c), as more examples have been found during recent fieldwork.
Apart from its denominal use, sv– can derive transitive verbs out of ideophones.\(^{25}\) For instance, out of the ideophone \(\text{lts}^3\text{vlt}^3\text{v}t\) ‘slightly vibrating (as hair, small threads)’ (basic root \(\text{lts}^3\text{v}t\)), one can derive the transitive verb \(\text{sv-lts}^3\text{vlt}^3\text{v}t\) ‘to shake slightly’. This derivational process is extremely productive.

Additionally, we find two other homophonous prefixes. One simply results from the fusion of the causative \(\text{sw}–\) with the passive \(\text{a}–\) and will not concern us here (\(\text{mbi} \to \text{give}, \text{jts}^3\text{i} \to \text{to give to drink} \to \text{sw-a-} \to \text{mbi} \to \text{to ask to be given something}, \text{sw-a-jts}^3\text{i} \to \text{to ask for something to drink}\)).

The other \(\text{sv}–\) prefix, the de-experiencer, derives a stative verb out of an intransitive or a transitive verb. When applied to an intransitive verb, the S of the base verb is deleted and replaced by the \(\text{stimulus}\). For instance, from the intransitive verbs \(\text{ngio} \to \text{slip}, \text{scit} \to \text{be happy}\) which can have a human S, one derives \(\text{sv-ngio} \to \text{to be slippery} (\text{of the ground})\) and \(\text{sv-scit} \to \text{to be nice}\) (of an environment, situation). In the case of transitive verbs, the S of the de-experiencer verb corresponds to the O of the base verb (cf. Jacques, 2012b).\(^{26}\)

We will see in Section 4.2 how the human antipassive, the denominal \(\text{sv}–\) and the de-experiencer are relatable historically.

### 3.4. Phonotactic constraints on derivational prefixes

In Japhug,derivational prefixes present important phonological constraints, limiting the number of possible forms. These prefixes are either mono- or disyllabic, the possible vowels are \(\text{u}, \text{v}\) and more rarely \(\text{a}\), and out of the 49 consonant phonemes, only nine (\(\text{m n r s/z /z /j y}\))\(^{27}\) are found in verbal derivational prefixes.

These strong phonotactic constraints suggest that, whatever the historical origin of these prefixes, they have undergone phonetic attrition and a series of mergers specific to the prefixal position that may have blurred their historical origin.

Thus, the mere fact that two prefixes share a common pronunciation and related semantics is not sufficient to prove that they are historically related, as the probability of chance resemblances is too high. In the following section, we will therefore focus on irregular derivations, as irregularities are the most efficient tool to test historical hypotheses (Schindler, 1972).

### 4. Evidence for the denominal origin of the antipassive prefixes

As presented in Section 1 of this paper, several origins have been documented for antipassive markers cross-linguistically: reflexive, reciprocal, indefinite person, and light verbs. It appears that none of these can explain the origin of Japhug antipassive markers in a straightforward way. Japhug has specialized and productive reflexive (the \(\text{z}y\text{y}–\) prefix, see Jacques, 2010b) and reciprocal (the \(\text{a}–\) prefix with reduplication of the last syllable of the verb stem) constructions, and none bear any phonetic resemblance to the antipassive prefixes. As for indefinite person, Japhug has a dedicated generic construction (with ergative alignment \(\text{k}u\text{u}–\) prefix for S/O and \(\text{w}y–\) for A, see Jacques, 2012b) and an indefinite determiner \(\text{ci}\), none of which has any similarity with the antipassive forms.

Finally, although examples of verbal prefixes originating from verbs have been documented in Japhug (in particular the associated motion prefixes, see Jacques, 2013), of all the light verbs found in the Rgyalrong languages, none bears any similarity to the antipassive markers.\(^{28}\)

On the other hand, we have shown that both antipassive markers are phonetically similar to denominal prefixes. This surface resemblance, though not conclusive by itself, is at least a necessary preliminary condition to investigating whether the two sets of prefixes (antipassive and denominal) can be related.

The following hypothetical derivation path in two stages can be proposed to account for the relationship between these prefixes:

1. A transitive verb is nominalized into an action nominal.
2. The action nominal is turned into a verb by a denominal construction deriving intransitive verbs.

Thus, although in this hypothesis antipassive prefixes do not originate from light verbs, this scenario is in fact very similar to that proposed for West Greenlandic and Mande.

---

\(^{25}\) This phenomenon has been first described in the related Tshobdun languages by Sun and Shidanluo (2004).

\(^{26}\) Two Japhug incorporating verbs \((\text{s}v\text{-mbru-ngu} \to \text{to be detectable})\) and \(\text{sv-zwu-lo} \to \text{to be disgusting}\) also include the de-experiencer prefix \(\text{sv}–\). The exact pathway of derivation of these two verbs is described in detail in Jacques (2012c: \S 4.1).\(^{27}\)

\(^{27}\) We could reduce this figure to seven, since the voiced fricatives /z/ and /\(\text{\j}z/\) and their voiceless counterparts /z/ and /s/ are never contrastive in prefixes, and their distribution is always predictable. Two more consonants (\(\text{n} \) and \(\text{l}n/\)) appear in non-finite verbal prefixes.

\(^{28}\) In Japhug the common light verbs are the following: \(\text{lt} \to \text{to throw}, \beta \text{zu} \to \text{to do}, \text{pa} \to \text{to do} \) and \(\text{tl} \to \text{to say} \).
An equivalent of stage 1 was present in West Greenlandic, since all three antipassive suffixes originate from the fusion of a nominalization/participial suffix followed by a verb. In Mande, no such stage can be detected, but this is probably due to the fact that these languages allow zero derivation between noun and verbs.

Stage 2 corresponds to the use of a verb meaning ‘make’ or ‘get’ in Mande and Eskimo, which are in these cases periphrastic denominal constructions, but can be applied to affixal denominal constructions such as those found in Japhug.

Japhug would thus only differ from the West Greenlandic situation in that the denominal markers cannot be etymologized as coming from verbs.

In the following sections, we evaluate whether this scenario is applicable to the case of Japhug. We first discuss the status of action nominalization in Japhug (the intermediate stage of the hypothesized grammaticalization pathway), and then present several idiosyncrasies which would be unexplainable without the grammaticalization scenario outlined above.

4.1. Non-human antipassive

In Japhug, as seen in Section 2.2, almost all deverbal nouns are marked with a specific derivational prefix, and thus any nominal derivation should preserve the nominalization prefix. This is indeed verified for cases such as nukumase ‘to be wrong’ (vi), a denominative verb derived from ku-ma-se ‘which is not’, the S-nominal of ma-se ‘not to be’ as well as the verbs in Table 16. It is clear that the antipassive prefixes ru– and su– cannot have originated from such nominalized forms.

Nevertheless, in Section 2.2.3, we saw that a few nominalized forms are simply formed by converting the bare verbal stem to inalienably possessed nouns, always taking possessive prefixes (bare infinitives and bare action nominals).

Thus, the antipassive ru–gₚⁿvt ‘to patch clothes’ of the transitive verb gₚⁿvt is actually synchronically ambiguous. It could be perfectly well analyzed as the nominal derivation in ru– from the inalienably possessed –gₚⁿvt ‘patch’, the bare action nominal derived from gₚⁿvt.

That this analysis is indeed possible is confirmed by the fact that the only bare action nominal whose indefinite possessive prefix is ru–. In Section 3.3.2, we saw that a few nominalized forms are simply formed by converting the bare verbal stem to inalienably possessed nouns, always taking possessive prefixes (bare infinitives and bare action nominals).

4.1.1. Irregular phonology

As seen in Section 3.3.2, only two antipassive verbs have a phonologically irregular form, one for which is ru-ᵣᵣa ‘to owe money’ from the verb ᶣᵣ ‘to buy on credit, to owe’.

The transitive verb ᶣᵣ takes as its object the amount of money owed (not the person to whom the money is owed):

(30)  

<table>
<thead>
<tr>
<th>squm-mpcar</th>
<th>kv-ᵣᵣa-t-a</th>
</tr>
</thead>
<tbody>
<tr>
<td>ten-leaf</td>
<td>PFV-owe-PST:TR-1SG</td>
</tr>
<tr>
<td>‘I (bought it on tick and) owe ten yuan.’</td>
<td></td>
</tr>
</tbody>
</table>

With the antipassive ru-ᵣᵣa, the amount owed cannot be specified. The antipassive form is irregular in that an extra element n– appears between the antipassive prefix and the verb root. It is noteworthy that the inalienably possessed noun

---

29 We saw in Section 3.3.1 that inalienably possessed nouns whose indefinite possessive prefix is ru– generally make their denominal verbs in ru– while those in ru– always have denominal verbs in ru–.
that inalienably possessed nouns form their denominal verbs with either the ɬ of the Japhug antipassive accounts for the observed data, the bare action nominals in antipassive.

While in the case of ɬpʰr'xt ‘patch clothes’ one could argue that the resemblance between the antipassive marker r– and the intransitive denominal prefix is fortuitous, this option is not available in the case of rɤ– ‘owe a debt’. The common irregularity between the nominal form rɤ– ‘debt’ and the verb rɤ– ‘owe a debt’ shows that rɤ– cannot have been directly derived from the base verb ɤa ‘to owe’, and that the inalienably possessed noun rɤ– ‘debt’ was the intermediate stage of derivation.

Unlike ɬpʰr'xt ‘to patch clothes’ above, the pathway of derivation occurred in three stages:

1. ɤa ‘to owe’ → action nominal *tuw-ɤa ‘debt’
2. conversion into an inalienably possessed noun with syncope of the prefix vowel *tuw-ɤa → *-t-ɤa → rɤ-ɤa ‘(someone’s) debt’
3. denominal derivation from the inalienably possessed nominal into an intransitive verb rɤ-ɤa → rɤ-ɤa ‘to owe a debt’

This example shows that while the basic scenario ACTION NOMINALIZATION + INTRANSITIVE DENOMINAL DERIVATION for the origin of the Japhug antipassive accounts for the observed data, the bare action nominals in ɬr– are not necessarily the only intermediate nominalized stage of this grammaticalization pathway.

4.1.2. Irregular semantics

The transitive verb puɤə ‘to turn around’ has an antipassive rɤ-puɤə ‘to reclaim land’ which is not irregular phonologically like the previous example, but has semantics which are much more restricted than that of the base verb.

The irregular semantics, here again, is not specific to the antipassive form: it is shared with the action nominal twu-puɤə which means ‘land reclamation’ and not ‘turning over’ as would be expected (cf. Section 2.2.2). This commonality shows that the action nominal and the antipassive form are related. Two hypotheses could be put forth to explain this common innovative meaning: either the antipassive is a denominal verb derived from the action nominal in twu–, or both the action nominal and the antipassive are linked to one another by a third form which was lost in the modern language.\(^{30}\)

The first hypothesis, derivation from an action nominal in twu–, is problematic: as we saw in Section 3.3.1, there are two examples of denominal verbs from action nominal, and they preserve the twu– derivational prefix (twu-sqa ‘wheat porridge’ → ru-tw-sqa ‘to have wheat porridge’, cf. Table 16). The expected denominal verb from twu-puɤə ‘land reclamation’ would thus be unattested \(\dagger\) ru-tw-puɤə instead of rɤ-puɤə ‘to reclaim land’.

The second hypothesis would imply the existence of a possessed noun *-puɤə ‘reclamation of’ (a particular place), from which rɤ-puɤə would be directly derived. This noun could simply be the bare infinitive derived from puɤə: we saw that a synchronic alternation between action nominals and bare infinitives is still productive in complements of the verb za ‘to start’ (see example 15, Section 2.2.3).

We have shown that the rɤ– non-human antipassive in Japhug can be explained as originating from the reanalysis of the denominal prefix rɤ– applied to inalienably possessed action nominals deriving from transitive verbs. Reanalysis occurred either from a bare action nominal, the bare infinitive or from an inalienably possessed nominal derived from the twu– action nominals which underwent vowel loss and cluster coalescence.

The fact that this hypothesis explains common phonological and semantic irregularities between action nominals and antipassive verbs is a confirmation that the formal resemblance between the antipassive and the denominal prefixes is not a coincidence, but that the two constructions are historically related.

4.2. Human antipassive

In the previous section, we showed that the non-human antipassive rɤ– prefix was historically derived from the denominal ruu-ɤr– prefix. It is thus legitimate to attempt to apply the same explanatory model to the human sx– antipassive.

\(^{30}\) The third possibility, namely a derivation from the antipassive to the action nominal, is impossible, as the derivational prefix rɤ– would not disappear.
In Section 3.3.1, we saw that a denominal prefix derives intransitive stative verbs designating an intrinsic property or mental state in examples such as \(-nd\,\gamma\) ‘poison’ \(\rightarrow\) \(-svnd\,\gamma\) ‘to be poisonous’.

This derivation is semantically very close to the stative propensity antipassive described in Section 3. Using the same chain of derivation as for the \(\gamma\)– antipassive, we propose the following scenario to explain the origin of the human antipassive in Japhug:

1. As in the case of the \(\gamma\)– antipassive, a transitive verb is turned into an inalienably possessed bare action nominal or a bare infinitive. (\(s\,\alpha\) ‘to kill’ \(\rightarrow\) \(-s\,\alpha\) ‘killing’)
2. The action nominal undergoes denominal derivation with the prefix \(s\,\gamma\)– into a property stative verb. (\(\sim\,s\,\alpha\) ‘killing’ \(\rightarrow\) \(s\,\gamma\)-\(s\,\alpha\) ‘to have a propensity to kill, to have killing power’).
3. This stative verb is reanalyzed as an action verb due to some ambiguous contexts (\(s\,\gamma\)-\(s\,\alpha\) ‘to have a propensity to kill’ \(\rightarrow\) \(s\,\gamma\)-\(s\,\alpha\) ‘to kill people’).

The de-experiencer \(s\,\gamma\)– described in Section 3.3.3 can be explained as having undergone the same steps of reanalysis, except that the re-alignment of syntactic primitives occurred in a different way (\(S = A\) of base verb in the case of antipassive, \(S = \) stimulus in the case of de-experiencer).

Unlike the case of the \(\gamma\)– antipassive, for the human antipassive we do not have any irregular verb showing shared idiosyncrasy between action nominal and human antipassive or de-experiencer as the examples discussed in Sections 4.1.1 and 4.1.2. Thus, this hypothesis, while plausible, cannot be considered to be fully demonstrated until such an example is discovered.

4.3. A chain shift?

The presence of two antipassives in Japhug raises the question of how systems with human vs. non-human antipassive come into being. To our knowledge, only one case has been discussed in the literature, that of Nahuatl \(t\,\epsilon\)– ‘human antipassive’ (generally called ‘indefinite human object’) vs. \(t\,\alpha\)– ‘non-human antipassive’ (‘indefinite non-human object’).\(^{31}\) We will describe the Nahuatl data and then compare them with Japhug to evaluate whether the two languages attest the same type of evolution.

A detailed study on the etymology of the Nahuatl antipassive \(t\,\alpha\)– and \(t\,\epsilon\)– prefixes is still lacking, but these prefixes have clear cognates in other languages. Langacker (1977: 46) argues that the prefixes *\(t\,\alpha\)– ‘unspecified subject’ and *\(t\,\epsilon\)– ‘unspecified object’ can be reconstructed in proto-Uto-Aztecan. The *\(t\,\alpha\)– ‘unspecified subject’ prefix itself is probably related to the indefinite pronoun *\(h\,\i\,t\,a\) ‘something’ (Langacker, 1977: 120).

In Nahuatl these prefixes yield *\(t\,\alpha\)– \(\rightarrow\) \(t\,\alpha\)– ‘non-human antipassive’\(^{32}\) and *\(t\,\epsilon\)– ‘human antipassive’, with a chain (push) shift:

- GENERIC AGENT \(\rightarrow\) NON-HUMAN ANTIPASSIVE
- ANTIPASSIVE \(\rightarrow\) HUMAN ANTIPASSIVE

By contrast, there is no evidence in Japhug that such a chain shift took place. The difference of meaning observed in the two antipassives \(\gamma\)– and \(s\,\gamma\)– directly reflects that of their corresponding original denominal prefixes \(ru\,\gamma\)–(production/action) and \(s\,\gamma\)– (property of the base noun to which humans or non-humans can be susceptible).

The fact that secundative ditransitive verbs have an antipassive in \(\gamma\)– instead of expected \(s\,\gamma\)– (see Section 3.2) does not imply that antipassive in \(\gamma\)– used to be the general antipassive, later superseded by \(s\,\gamma\)– for monotransitive verbs. Rather, it is likely that it is due to homophony avoidance with the combination of the causative with the passive \(su\,\alpha\) + \(\,a\) \(\rightarrow\) \(s\,\gamma\)– which is found with this type of verbs (as in \(m\,b\,i\) ‘to give’ \(\rightarrow\) \(su\,\gamma\)– \(m\,b\,i\) ‘to ask to be given’). Since this combination of derivational prefixes is not attested with monotransitive verbs, this homophony avoidance was limited to ditransitive verbs.

Thus, the model of evolution presented in Japhug enriches our knowledge of the possible origins of human vs. non-human antipassive systems, as the development attested in Japhug seems without clear parallel elsewhere.

4.4. Other derivations

The pathway of grammaticalization proposed in the previous sections to explain the origin of the antipassive prefixes can also potentially be applied to other voice markers, in particular the applicative \(nu\)– and causative \(su\)– prefixes. In this paper, only the case of the applicative will be discussed in detail.

---

\(^{31}\) The analysis of these prefixes as antipassive markers has been proposed by Creissels (2006: 91).

\(^{32}\) By the application of Whorf’s law *\(t\,\alpha\) \(\rightarrow\) \(t\,\alpha\).*
The applicative \textit{nɯ}-- can be illustrated by the examples in Table 21. We also find a denominal prefix \textit{nɯ}-- in Japhug, which mainly derives transitive verbs, as illustrated in Table 22. Although a few intransitives derived by the prefix \textit{nɯ}-- are attested, when a pair of transitive and intransitive verbs are derived from a single noun, the productive pattern is to have an intransitive verb in \textit{rɯ}--/\textit{rɤ}-- and a transitive one in \textit{nɯ}--, as illustrated in Table 23 with Tibetan loanwords.\footnote{Respectively from Tibetan \textit{btə.a.ka} ‘method’ and \textit{kʰram.ba} ‘lie’.}

5. Conclusion

The present paper contributes to the general theory of grammaticalization in documenting a previously unreported origin for voice markers. It shows that voice markers, in particular the antipassive but also potentially the applicative and other ones, can be formed historically out of a double derivation:

\begin{equation}
\text{(31)} \quad \text{NOMINALIZATION} + \text{DENOMINAL DERIVATION} \Rightarrow \text{VOICE DERIVATION}
\end{equation}

More specifically:

\begin{equation}
\text{(32)} \quad \text{ACTION NOMINALIZATION of transitive verb} + \text{INTRANSITIVE DENOMINAL DERIVATION} \Rightarrow \text{ANTIPASSIVE}
\end{equation}

\begin{equation}
\text{(33)} \quad \text{ACTION NOMINALIZATION of intransitive verb} + \text{TRANSITIVE DENOMINAL DERIVATION} \Rightarrow \text{APPLICATIVE/CAUSATIVE}
\end{equation}
The reason for this derivation in two steps is that action nominalization first neutralizes the original transitivity of the verb root, and a new transitivity value is allocated by a specific denominal derivation.
